

Notes on email correspondence between Hilda Hu (Sales Manager) of SAFS Steel Solutions and Repair Lab team member, February 22, 2024.

- “1. Regarding the issue of dust inside the dome, since we are the material supplier, the specific operation of the equipment inside the dome will be calculated and tested by the owner's engineers, we need to provide the appropriate structure as well as materials in accordance with the owner's needs to ensure the safety as well as the stability of the building, and regarding the issue of the internal dust, we will do a good job in protecting the measures, but the specific way of dealing with it is still up to the customer to decide.
- 2. Regarding the cost of coal silo, because our products are customized products, there are many factors affecting the price, we need to analyze and calculate according to the specific information of the project, in order to give a reference value of the price, there is no uniform pricing for the time being.
- 3. We have rich experience in building dome coal silos, we have project experience in many countries, and we have built coal silos in countries with extreme weather without any safety problems so far, we hope that we can have the opportunity to cooperate, and we will show you the most competitive products.”

Notes on email correspondence between Hilda Hu on February 27, 2024

- “1. We are a professional steel structure manufacturer, mainly responsible for the production and transportation as well as the installation part of the project, at the same time, we will sign a confidentiality agreement to ensure the safety of the customer's project information, about the customer's project experimental testing we are not convenient to disclose for the time being.
- 2. According to our past project experience, the cost of coal silo dome is about 70-120 USD/m², but the cost varies with different project size, mainly according to the structural form of the building, the size and the materials used, if you can provide part of the project information, I think we can estimate a more suitable reference cost.
- 3. We have recently had a project of dome coal silo in the Philippines, the Philippines has more typhoons, so the requirement of structure is very high, and because of the proximity to the sea, there are some requirements for corrosion protection, so the cost will be a little higher than the ordinary dome coal silo. I have put our past project experience in the attachment below for your reference. I hope it will be helpful to you.”
